

PulpFx Abstract

LIGHT SLICE (Generator)

→ Generates a slideshow based on a picture folder.

➤ Effect Parameters

Images Sources

Click on this button to select the pictures that will be used in the slideshow. Once the selection is completed a new window opens. It permits to change the picture's order of appearance and their title.

Presets

Presets contain a snapshot of the plug-in parameters. The Presets control lets you choose among one of the presets built into the plug-in, save current parameter values to a preset file, or load an existing preset file from disk. A preset file saved to disk via the "Save As" button can be loaded from another instance of the same plug-in by clicking the "Open" button. Presets generated in one host can also be loaded from the same plug-in when used in a different host.

The number of layers used for each media. Note: This effect can take up a large amount of memory if you use too many layers.

Overlap Value

The extent of overlap between each layer.

Quality

You can reduce the quality of your media to avoid memory capacity issues.

Background Color

The color of the background.

➤ **Timing**

Pre-Roll

Pre-roll duration before the beginning of the animation.

Image Duration

The duration of each media.

Transition Duration

The duration of each transition between media.

➤ **Transition Used**

There are nine effects to display your media. These effects are chosen randomly. You can disable each effect if you wish. If no effect is chosen, the slideshow will use the simple fade effect as default.
