

PulpFx Abstract

SPHERE

➤ Effect Parameters

Images Sources

Click on this button to select the pictures that will be used in the slideshow. Once the selection is completed a new window opens. It permits to change the picture's order of appearance and their title.

Presets

Presets contain a snapshot of the plug-in parameters. The Presets control lets you choose among one of the presets built into the plug-in, save current parameter values to a preset file, or load an existing preset file from disk. A preset file saved to disk via the "Save As" button can be loaded from another instance of the same plug-in by clicking the "Open" button. Presets generated in one host can also be loaded from the same plug-in when used in a different host.

Media Size

The media size.

Element Max Size

The element maximum size (in pixels).

Note: For better performance during edition, it's recommended to down the size.

➤ Timing

Pre-Roll

Pre-roll duration before the beginning of the animation.

Image

The duration of each media.

Transition

The duration of each transition between media.

➤ Background

The background is a gradient.

➤ Sphere

Sphere radius

The radius of the sphere.

Quantity

The quantity of element on the sphere.

Element size

The element size.

Offset

The offset between the current media layer and the other layer on the sphere.

Offset Pulse Period

The offset pulse period.

X Rotation Duration (in seconds)

The X sphere and layers rotation duration .

Y Rotation Duration (in seconds)

The Y sphere and layers rotation duration.

Layer Count

The number of layer in the sphere

Holes Quantity

Holes quantity on the sphere.

Fog

The background media opacity.

Explode

The sphere explode each x media, x is specified with "Explode" parameter.

Element Depth

The element depth.

Element Color

The back color of the elements.
